Explanation of Idea:

    1) Product/Service Name

Volleyball Data Analysis and Fan Lineup Creation Platform

    2) Product/Service Description

This platform is a service that allows fans to analyze volleyball data in depth and form a starting lineup by selecting the team they want.

    3) Customer experiences issues:

Currently, there are not many sites that provide data related to the Korean professional volleyball league, and KOVO (https://kovo.co.kr/KOVO/stats/player-record), but only statistical basic data and various visualization graphs do not exist. When fans want to check in-depth analysis or indicators of players' performance, it is difficult to look for overseas sites in person. In addition, while there are services for forming a starting lineup consisting of players that fans want, soccer and other sports, related services are lacking in volleyball
    4) Solving Issues:

A. In-depth analysis:

- Introducing a service that allows users to visualize and analyze various volleyball-related data makes it easier to understand the performance of the players. Accordingly, by selecting a team to be checked, the indicators of the players corresponding to that team and the performance of the players by position can be grasped in the graph. Through this, information such as weaknesses or strengths of each player can be obtained, and based on this information, they will be able to enjoy volleyball games more interestingly.

B. Lineup configuration:

- The user who uses the service can select the desired team through an intuitive interface and then select and configure the player lineup. It can help you find the best combination because you can check the statistics for each player and then organize the lineup.
